LAX Flies First Class with GlasPro

Fabrication Excellence at New International Terminal

Los Angeles, California

At over 60,000 total square feet, the interior glass elements of the Los Angeles International Airport Terminal represent a significant achievement in both quantity and quality of fabrication for GlasPro. Over-sized lites in excess of 76" x 145" in coordination with a stringent production and delivery schedule made this such an amazing collaborative achievement.

This challenging undertaking demanded a high level of technical aptitude and logistical innovation. More than 530 panels that were used as handrails, jumbo partitions and storefronts required immaculate flat-polishing with many calling for extensive fabrication of specialized cut-outs and holes. Movement and delivery of this much glass was accomplished via specialized packing procedures and the coordination of off-hour deliveries.

GlasPro was able to meet each challenge the LAX International Terminal project presented with unique and beautiful solutions. The size and scale of this job is yet another example of the fabrication excellence we have come to expect from GlasPro.
